Folder Reference: Document/Project

Design Phase/ Includes:

- Problem-Solution Fit Template
 - Proposed Solution
 - Solution Architecture
 - Readme.md

1. Problem-Solution Fit

Problem: Inefficient manual tracking and delayed stock updates.

Solution: Automated, centralized system with real-time inventory visibility and AI-assisted forecasting.

Key Fit Indicators:

- Reduces manual labor.
 - Enhances supply accuracy.
 - Prevents stockouts and wastage.
-

2. Proposed Solution

The **Medical Inventory Management System** will automate stock monitoring, provide analytics, and facilitate communication between pharmacy, procurement, and administration departments.

Core Functionalities:

- Barcode scanning for each medicine batch.
 - Intelligent reorder point detection.
 - Automatic purchase order creation.
 - Expiry management dashboard.
 - Role-based permissions.

3. Solution Architecture (Conceptual)

Layers:

1. **Frontend (Client Layer):** ReactJS UI for user interaction.
2. **Backend (Application Layer):** Express.js handles routes, logic, and security.
3. **Database Layer:** MongoDB stores stock, supplier, and transaction data.
4. **Integration Layer:** APIs connect barcode scanners and alert systems.

Architecture Flow:

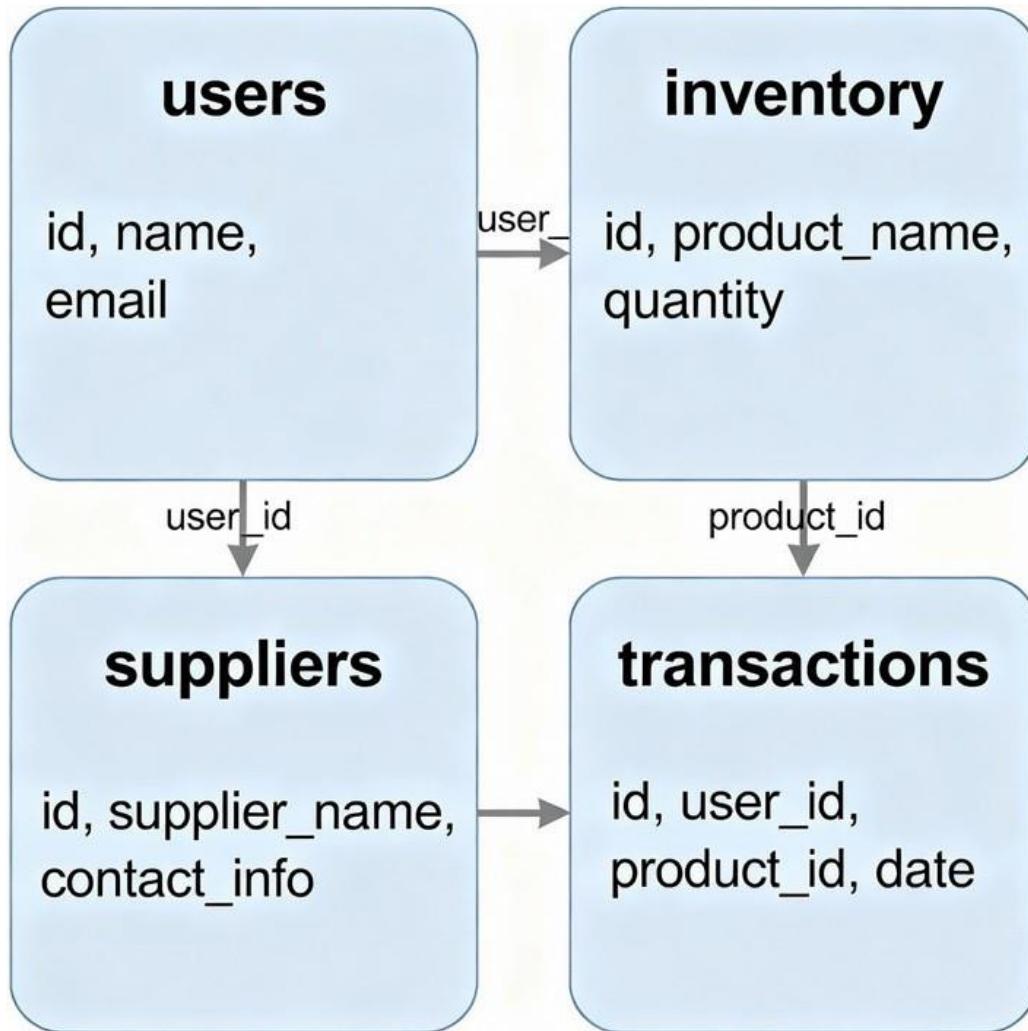

User → UI → API → Database → Response → Dashboard.

4. Database Design (Overview)

Collections:

- users—user details, roles, authentication.
- inventory – item name, batch no., expiry date, stock count.
- suppliers – supplier info, purchase records.
- transactions – issue and return logs.

5. Advantages

- Real-time synchronization across departments.
- Modular, scalable, and secure.

Easy-to-use UI for all staff roles.
